

Title: kassa/store management app

Description:

I want to build an replacement for cashiers systems because in my experience they are all really outdated and could use some improvement. We are able to have multiple cashiers working and they can add items to a customer bill, as well as remove them. At the end the customer pays their bill and the bought items are removed from store stock. Ofcourse there are situations where items are stolen or lost. For simplicity sake we are ignoring that.
